

psyc_prsc2021

Version: 1.0 (April 4, 2024)

This document is available at Open Science Framework (OSF) (<https://osf.io/dspgq>). If you have any questions or suggestions, or you identify a mistake in our documentation or code, please contact us at lml@clin.au.dk and/or opr@clin.au.dk.

The dataset `psyc_prsc2021` contains information on all redeemed prescriptions with Anatomical Therapeutic Chemical (ATC) codes N01-N07 between January 1, 1995, and December 31, 2021, for all individuals living in Denmark during that period. There is one observation for each redeemed prescription, including the detailed ATC code, the date of dispensing, and the indication for the prescription, if available.

Code: `psyc_prsc2021.R` (R code)
Output: `psyc_prsc2021.RData` (R file)
`psyc_prsc2021.dta` (Stata file)
`psyc_prsc2021.csv` (CSV file)

The dataset is created based on the following registers:

- Register `population1986_2021`, which includes basic information on all individuals living in Denmark between January 1, 1986, and December 31, 2021. We have created this dataset based on the registers from [Statistics Denmark](#) (DST) on population ('[Befolkning](#)'; BEF) and deaths in Denmark ('[Døde i Danmark](#)'; DOD). Specific details and R code are available on OSF (<https://osf.io/dspgq>).
- The Danish National Prescription Registry,^{1,2} which contains detailed information on prescriptions redeemed at community pharmacies in Denmark since 1995. There are three notable instances when drugs are not filled at community pharmacies and thus are not captured by the registry: (i) drugs used during hospital admissions; (ii) drugs used by certain institutionalized individuals (typically due to psychiatric illnesses);

and (iii) drugs supplied directly by hospitals or treatment centers (e.g., chemotherapeutic agents, immunosuppressant drugs, and methadone for those with substance use disorders). The register is available through the [Danish Health Data Authority \(Sundhedsdatastyrelsen; SDS\)](#) through [Lægemiddelstatistikregisteret](#), or through [Statistics Denmark](#) drug database ([‘Lægemiddeldatabasen’](#); LMDb).

Dataset `psyc_prsc2021` contains all redeemed prescriptions with ATC codes N01-N07. The final dataset contains 305,045,827 observations from 4,910,924 unique identifiers with the following variables:

- **pnr**: Unique personal identifier. All individuals born or immigrating to Denmark receive a unique personal registration number (CPR number) containing 10 digits. Based on different digits' positions, the CPR number contains information on the date of birth and sex. The [PNR number](#) is a de-identified version of the CPR number made by DST that does not include personal information but allows linkage between different registers based on this unique identifier.
- **sex**: Sex based on DST's variable [koen](#) (1: male; 2: female), indicating the legal sex of the individual based on information from the CPR number.
- **birth_d**: Date of birth based on DST's variable [foed dag](#).
- **atc**: Anatomical Therapeutic Chemical (ATC) code for the drug.
- **date**: Date of dispensing.
- **indication**: Indication code for prescribing, if available, based on the variable [indo](#). The variable was introduced on April 1, 2004. However, the doctor may choose to write an unapproved indication or to formulate the indication differently in free text, and in these cases, an indication code is not reported. In 2012, the proportion of prescriptions with a completed indication code was approx. 73%.³
